## Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method of producing a transmissive screen having a
structure including light-transmissive substrate, lens members and light-absorption-material
patterns, comprising:
forming the light-absorption-material patterns; formed at locations
corresponding to locations of lens members, which are provided side by side on a light-
transmissive substrate, and to locations of boundary portions between the corresponding lens
members, the method comprising the step of forming
discharging lens compositions of at least one of the lens members or
precursors thereof by causing very small drops of lens compositions to be discharged and to
land near a light-transmission area on a surface of of the lens members towards the light-
transmissive substrate; and
forming the lens compositions into the lens members as boundary portions of
the precursors of the lens members are formed over the light-absorption-material patterns, ar
as the light-absorption-material natterns are formed
